

ShipSnap

ERP-connected delivery planning, driver execution and proof of delivery for companies that need verifiable field operations.

Route planning

Driver app

ePOD

ERP sync

Business outcome

ShipSnap gives operations teams a controlled system for local deliveries: route planning, delivery status, customer communication and documented proof of delivery are handled in one digital flow.

Core capabilities

- Plan and optimize routes using variables such as customer time windows, driver schedules, shipment weights, volumes and pallet counts. Based on our proprietary AI.
- Capture delivery confirmation with digital signatures, photos, comments, timestamps and location evidence.
- Control loading and unloading, reduce missing items, and maintain live package status throughout the delivery chain.
- Support external or third-party drivers through QR-based customer confirmation and signature capture.

Workflow + integration

- Drivers work from mobile devices; signed delivery documents return to the ERP in real time.
- Offline use is supported, with synchronization when connectivity is restored.

DocReader

AI agents for reading, validating and pushing business documents and transactional data into the ERP.

AP automation

Data capture

Validation

ERP entry

Business outcome

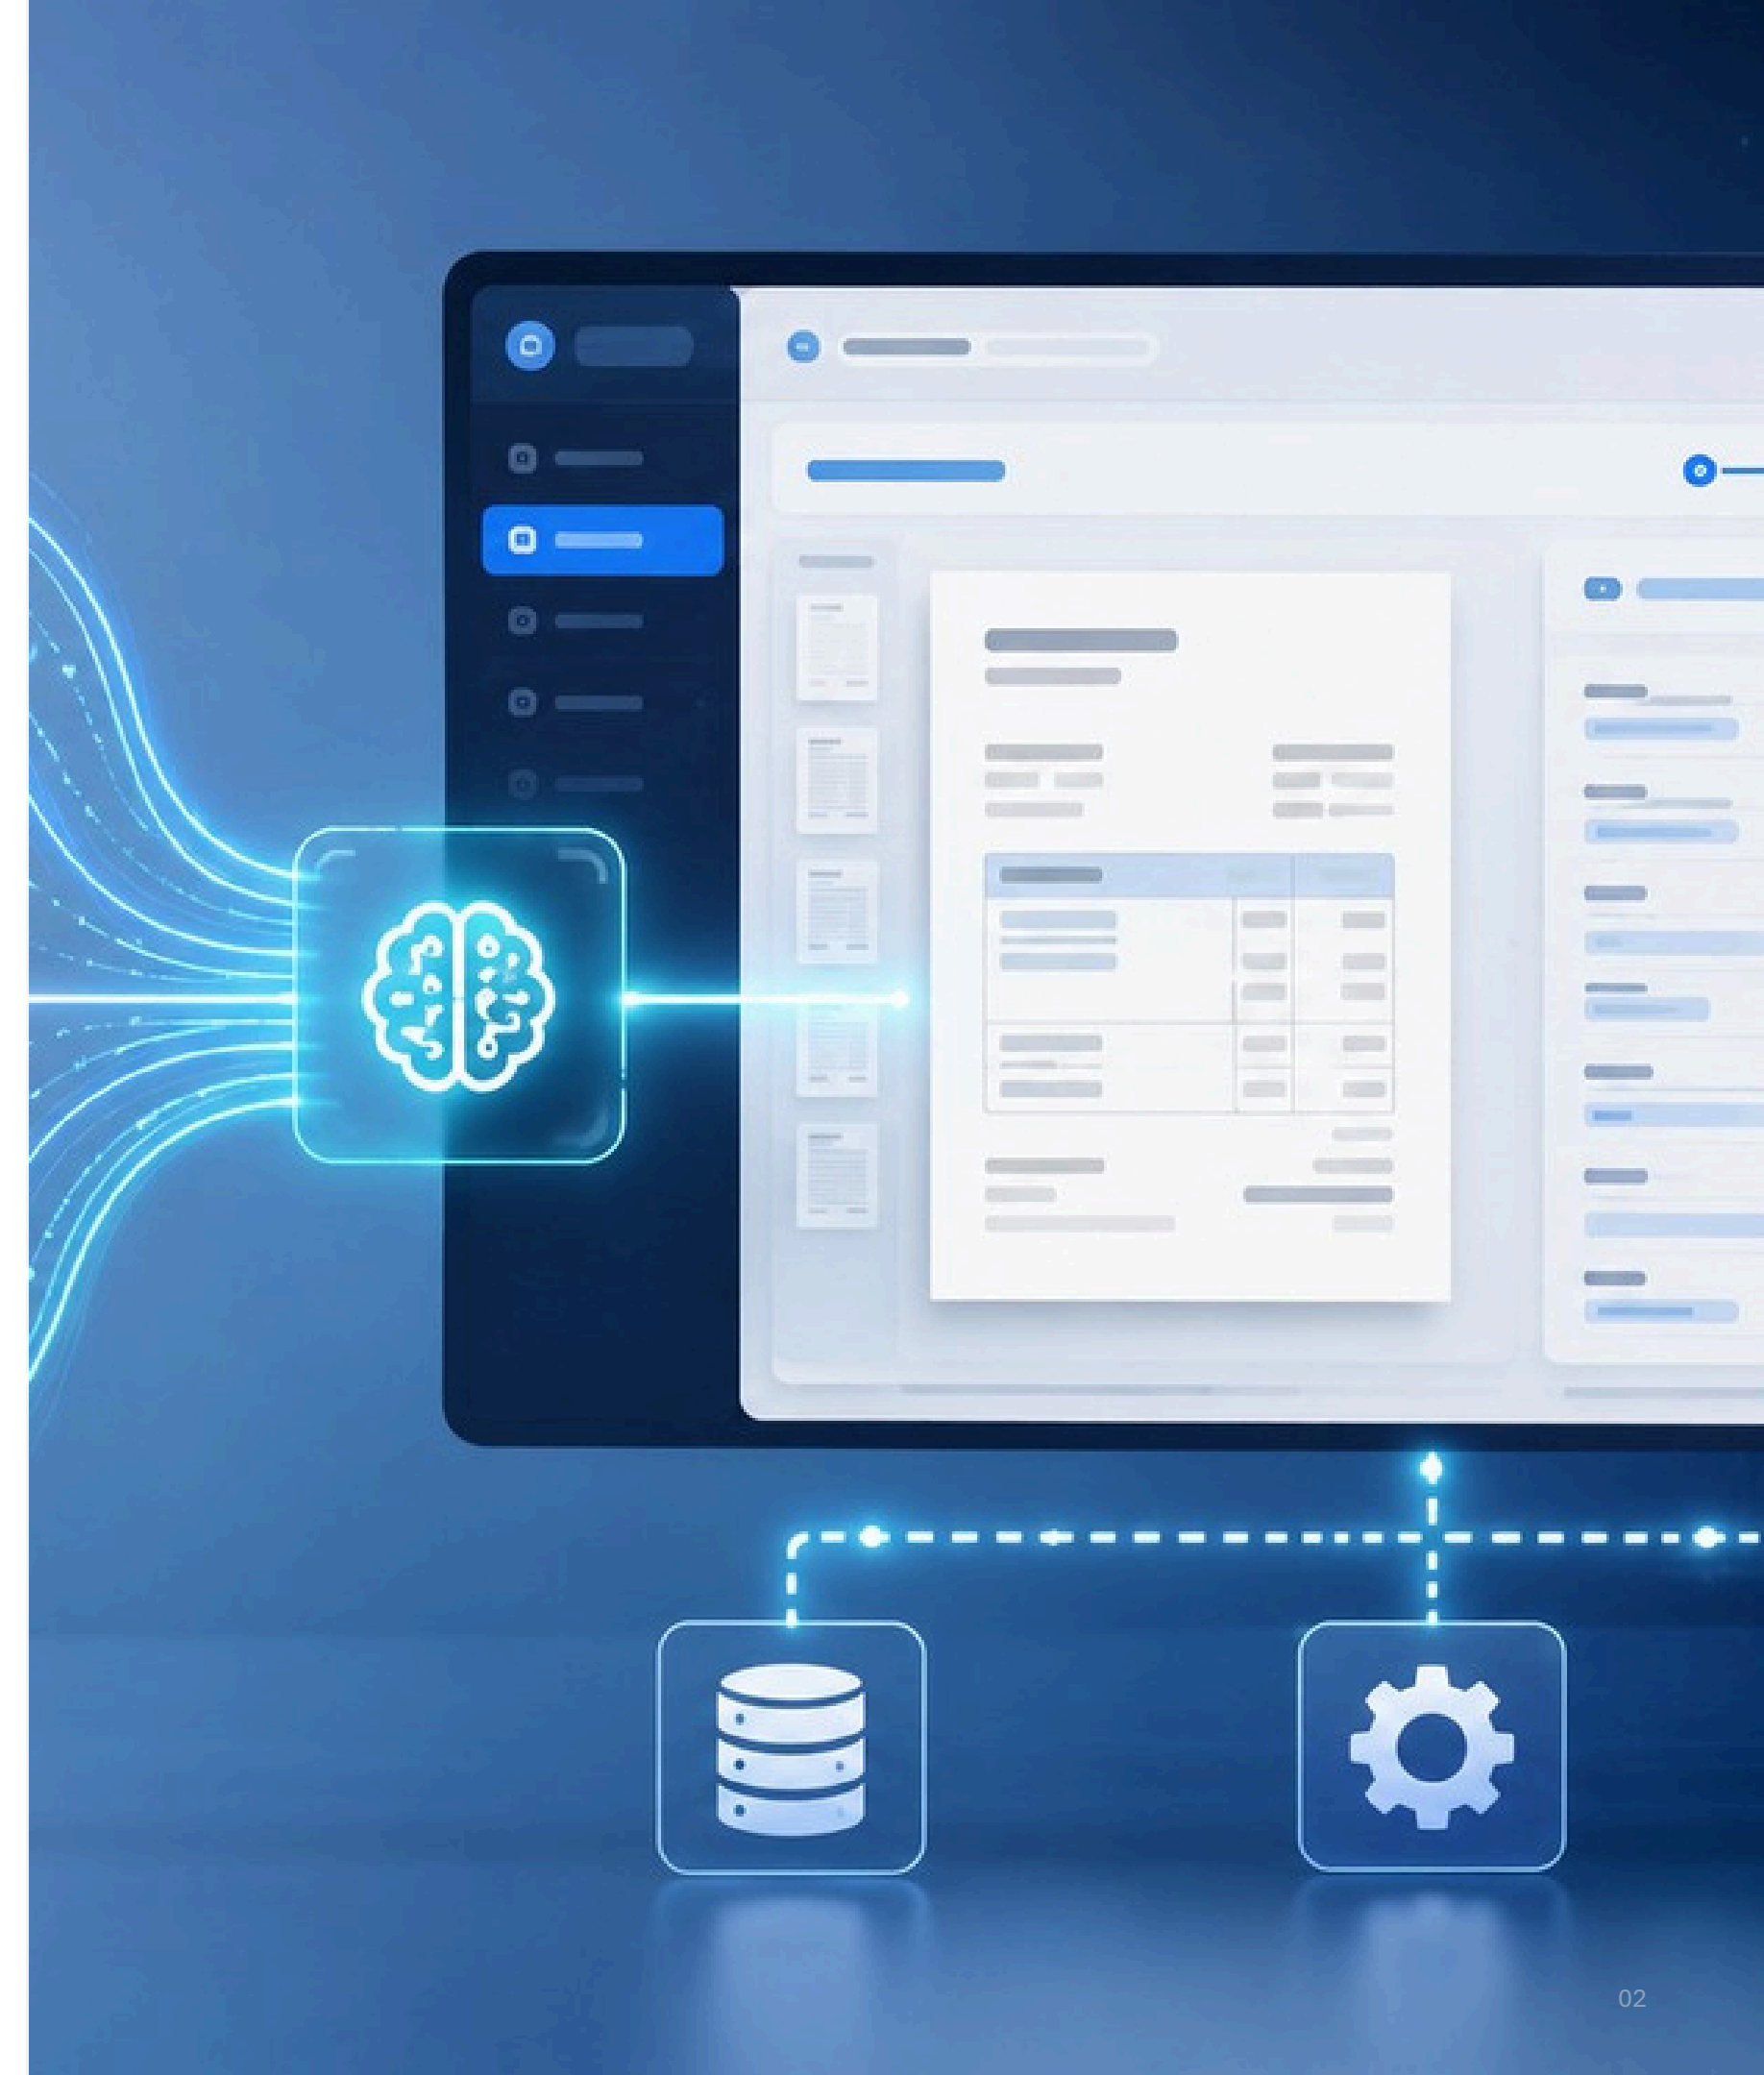

DocReader reduces manual document intake by extracting structured data from invoices and other incoming business documents, then preparing the validated transaction for downstream ERP processing.

Core capabilities

- Ingest PDFs, images, scans and email attachments from multiple intake channels.
- Read document fields and line-level values and prepare structured outputs for validation.
- Support approval or exception flows when information requires review before posting.
- Reduce repetitive accounting and administrative entry work while improving document traceability.

Workflow + integration

- Designed to connect document capture with ERP transaction records and approval workflows.
- Can complement Smadar archive and DocCycle approval/signature flows.

DocCycle

Smart digital-signature and document-approval workflows for internal teams, customers and suppliers.

Approval routing

Remote signing

Identity checks

Audit trail

Business outcome

DocCycle brings order and transparency to document approvals by defining who must sign, tracking progress, sending reminders and returning completed documents to the archive or ERP.

Core capabilities

- Create controlled signing rounds for purchase orders, agreements, quotes, certificates and other documents.
- Send documents through links by email, SMS or messaging apps for external or internal signing.
- Track every action with timestamps and maintain a controlled record of the signing process.
- Support identity verification with ID-document photo and live selfie comparison where required.

Workflow + integration

- Documents can be filed to the digital archive, local server or organizational cloud.
- Browser, Android and iOS access enables signing from desktop and mobile environments.

xPress3

Automated barcode and label printing using live data from ERP systems, databases, cloud applications and files.

ERP data

Label design

Cloud data

Print automation

Business outcome

xPress3 converts operational data into accurate, production-ready labels and barcodes. It reduces manual preparation, standardizes label output and enables teams to print current information directly at the point of work.

Core capabilities

- Generate labels, barcodes and dynamic images from real-time ERP and database records.
- Design and customize label layouts through a graphical interface.
- Operate as an integrated solution or as a standalone application.
- Import data directly from Excel, CSV and ASCII files for flexible production workflows.

Workflow + integration

- Connect to web-based and cloud applications to retrieve current data for immediate printing.
- Support centralized label logic across operational systems, data sources and connected printers

Winsert

A central document-processing and integration hub that captures information, applies business logic and coordinates data exchange across systems.

Multi-channel capture

Data extraction

Business rules

System integration

Business outcome

Winsert turns documents and data into automated business processes. It connects previously fragmented inputs, decisions and enterprise systems so information can move reliably without repetitive manual handling.

Core capabilities

- Capture documents through virtual printers, monitored folders, email inboxes, SFTP servers and other endpoints.
- Analyze content, extract business data and query databases or third-party systems.
- Apply custom scripts, validation logic and business rules to trigger automated actions.
- Add content, modify layouts, split or merge documents, and convert file formats.

Workflow + integration

- Connect SPS products including ShipSnap, DocCycle and DocReader with ERP, CRM and other enterprise platforms.
- Serve as a reusable integration layer for document, print and interface-based workflows.

ShipSnap QR

Proof of delivery for drivers you don't employ: the recipient scans a QR code on the delivery note and signs on their own phone.

Any driver

No app

QR on the note

ERP sync

Business outcome

Every delivery ends with a signed, time-stamped record in the ERP - no matter who delivered it. Fewer delivery disputes, faster invoicing, and no paper to collect, scan or store.

Core capabilities

- A QR code for each order, added automatically to the delivery note or label.
- The recipient scans it with their own phone - a signature field and photo capture open in the browser.
- Date, time, location, signature and photo are captured in one record.
- Works with third-party carriers, couriers and subcontractors - no app or login for the driver.

Workflow + integration

- The QR code is added when the document prints, through Winsert - no change to the ERP's document layouts.
- The signed document syncs to the order and customer record in SAP Business One or the ERP you run.

Other SPS products and modules

These capabilities may be treated as broader portfolio items or specialized modules.

Smadar

ERP-connected digital archiving that captures, signs, catalogs and retrieves business documents directly from the relevant ERP record.

SmartPrinter

Modernizes output from ERP and legacy systems by transforming, formatting, routing and archiving print streams without changing the source application.

SmartSign

Automatically identifies ERP-linked documents that are missing required signatures, reducing manual review and documentation errors.

XPress / Barcode Express

ERP- and database-driven barcode labels, stickers and variable document output.

OCR + supplier modules

Document scanning and extraction capabilities that feed archive, approval and accounting workflows.

Automatic collections

Overdue-invoice detection with scheduled reminders and attached digitally signed invoices.

Combined invoice

Customer invoice packages that include the related signed delivery notes as evidence.

Check reader / check printing

Check scanning, ERP attachment, bank-deposit support and blank-paper check output.

Send2ERP

Email and attachment capture into ERP screens, preserving message context and supporting files.

VPad / PadConnect

In-person signature surfaces and mobile pads for capturing signatures directly into business systems.

Portfolio thread: capture, validate, route, sign, deliver, print and archive operational evidence back into the ERP.
